Positivity Test

Sample Report

ID 22535-7

Date 11/22/2021

Standard

Overview

The Positivity Test (PT) is a self-report questionnaire for the assessment of positive attitude. It explores how people view themselves, their future, their life, and their general trust in others. The test provides two main scales, Positivity and Positive Orientation. Three dimensions of Positive Orientation are further distinguished: Orientation toward oneself, Orientation toward others and Orientation toward the future. Finally, two validity scales are provided to help with assessing the reliability of the responses: Heroic Perception and Moralistic Perception.

Structure of this report

- **Narrative**
 - **Introduction**
 - **Positivity and Positive Orientation**
 - **Positive Orientation Dimensions**
 - **Validity**
- **Profile sheet**
- **Table of scores**
- **Scale details**
- **Response statistics**

Only qualified psychologists or appropriately trained test users should interpret psychometric test results. Please follow the relevant guidelines from the appropriate professional body.

Positivity

Introduction

The Positivity Test presents 34 statements about how people face various aspects of daily life and asks test takers how strongly they agree or disagree with each statement.

These responses have been compared with the reference group “Working Population, U.S.”. If a different group had been chosen, the scores might have been somewhat different.

When interpreting the results, please bear in mind the following points:

- The results are based on how people perceive and describe themselves. This may sometimes appear inconsistent with information from other sources such as a conversation or interview. It can be useful to explore such inconsistencies and uncover possible reasons for them.
- The text in this report should be seen primarily as a guide for the formulation of hypotheses to be confirmed or rejected by other means, and the report has been structured to encourage interpretative reflection.
- The Positivity Test measures a number of separate scales, but it is important to interpret each scale against the backdrop of the others. In addition, the results should always be interpreted in the context of any other information available.

The text in this report is based on five score bands:

- T-scores of 34 and below will be described as “very low”. Approximately 6% of the reference group obtained scores in this range.
- T-scores between 35 and 41 will be described as “low”. About 14% of the reference group obtained scores in this range.
- T-scores between 42 and 58 are classified as “in the average range” or simply as “average”. This range comprises about 60% of the reference group.
- T-scores between 59 and 65 will be described as “high”. About 14% of the reference group obtained scores in this range.
- T-scores of 66 and above will be described as “very high”. Approximately 6% of the reference group obtained scores in this range.

Positivity and Positive Orientation

These two scales measure a cognitive, general and constant orientation that people use to give meaning to their existence. The **Positivity Scale** places more emphasis on “satisfaction with one’s own life”, while the **Positive Orientation Scale** is concerned with positive orientation towards oneself, others and the future.

The results suggest that this person often feels inadequate and dissatisfied with themselves and their experiences in the world. Despite possessing a positive network of relationships, he/she may tend to isolate or withdraw as a result of perceiving these relationships as difficult. This person sees the future as full of opportunities but may nevertheless doubt his/her ability to seize the opportunities that arise.

Positive Orientation Dimensions

Orientation toward oneself measures self-confidence and self-esteem, including the general feeling of self-acceptance that relates to one’s own abilities, personal qualities, character traits and external appearance.

Orientation toward others measures the level of trust, openness and expectations placed in other people, including the extent to which one is able to rely on and entrust oneself to other people.

Orientation toward the future measures the trust and the positive expectation that we place in future events, including the general feeling of optimism and enthusiasm regarding what is yet to come.

The average score for **Orientation toward oneself** suggests that this person has developed a positive attitude toward him/herself in general, although he/she may not be fully satisfied with every single aspect of his/her personality. This person has sufficient social skills and usually has an independent opinion on different topics. His/her assertiveness can sometimes be limited to situations that are more familiar.

The low score for **Orientation toward others** indicates that this person tends to have difficulty in interacting assertively with others and may therefore be submissive or compliant. He/she is reasonably open to collaboration with colleagues and can recognize the emotions of others, although he/she may not be able to actively stand up for him/herself in relationships. This person may demonstrate a reluctance to make and maintain lasting friendships.

The average score for **Orientation toward the future** indicates that this person has a largely positive attitude towards his/her future. In general, this person is curious and able to take personal initiative; he/she has a good capacity for innovation and a sense of entrepreneurship.

Validity

Heroic perception measures the extent to which a person tends to systematically exaggerate their personal skills and efficacy. **Moralistic perception** measures the extent to which a person is inclined to exaggerate their social and moral qualities. Either type of distortion, whether conscious or unconscious, can influence the accuracy of the other scores obtained in the test.

The score for **Heroic perception** is lower than average, so it is reasonable to assume that most answers given by this person are free from Heroic falsification and, in this respect, give an honest picture.

The score for **Moralistic perception** is lower than average, so it is reasonable to assume that most answers given by this person are free from Moralistic falsification and, in this respect, give an honest picture.

Scale details

Positivity Scale

Working Population, U.S. · T Score (50+10z)

Raw value	21
Normed value	32
Missing values	0
Confidence interval	[24 - 40]

This scale measures a cognitive, general and constant orientation that people use to give meaning to their existence. The scale is mainly concerned with “satisfaction with one’s own life”.

Positive Orientation Scale

Working Population, U.S. · T Score (50+10z)

Raw value	50
Normed value	41
Missing values	0
Confidence interval	[33 - 49]

This scale measures a cognitive, general and constant orientation that people use to give meaning to their existence. The scale is concerned with positive orientation towards oneself, others and the future.

Orientation toward oneself

Working Population, U.S. · T Score (50+10z)

Raw value	20
Normed value	50
Missing values	0
Confidence interval	[39 - 61]

This dimension measures self-confidence and self-esteem, including the general feeling of self-acceptance that relates to one's own abilities, personal qualities, character traits and external appearance.

Orientation toward others

Working Population, U.S. · T Score (50+10z)

Raw value	13
Normed value	37
Missing values	0
Confidence interval	[26 - 48]

This dimension measures the level of trust, openness and expectations placed in other people, including the extent to which one is able to rely on and entrust oneself to other people.

Orientation toward the future

Working Population, U.S. · T Score (50+10z)

Raw value	17
Normed value	43
Missing values	0
Confidence interval	[33 - 53]

This dimension measures the trust and the positive expectation that we place in future events, including the general feeling of optimism and enthusiasm regarding what is yet to come.

Heroic Perception

Working Population, U.S. · T Score (50+10z)

Raw value	11
Normed value	40
Missing values	0
Confidence interval	[30 - 50]

This validity scale measures the extent to which a person tends to systematically exaggerate their personal skills and efficacy.

Moralistic Perception

Working Population, U.S. · T Score (50+10z)

Raw value	12
Normed value	39
Missing values	0
Confidence interval	[28 - 50]

This validity scale measures the extent to which a person is inclined to exaggerate their social and moral qualities.
